### Overview

- Comparing Traditional and Open IP Business Models
- Example
- Implications
- Some Questions

### Capitalism vs Communism?

- Many businesses are built on earning revenue from exploiting rights under traditional copyright, eg:
  - Textbooks
  - Software
  - Research Journals
  - ...many others
- For many of these businesses, the idea of providing all copyright material at no cost sounds crazy at best...
  - "Communist", "IP destruction", "viral" at worst

### Open ≠ Revenue Free

- Earning revenue is quite common in the "open world"
  - Many FOSS developers provide fee-based development services (with code often released to all)
  - Stallman supports fees for distribution; dual licensing for FOSS
  - Fee-based training & consulting services
  - Pay-for printed books, with no cost version online
  - Articles/blogs/pictures online with in-page advertising
  - CC Non-Commercial: potential revenue from commercial use
- Even non-revenue-based approaches (eg, free content online) may lead to financial benefits later
  - Personal (and institutional) promotional and reputational benefits

# Conflicting Business Models?

Traditional Copyright Business	Open Copyright Business
Earns Revenue	Earns Revenue
Relies on copyright law as the foundation for business	Relies on copyright law as the foundation for business
Giving material away for free helps with promotion, marketing	Giving material away for free helps with promotion, marketing
Take legal action against those who break licenses	Take legal action against those who break licenses

## Conflicting Business Models?

- Obvious difference
  - Do you pay for copyright material or not?
    - (For open, are you free to change and redistribute)
- Underlying difference
  - A business model capable of providing large returns on risk capital investment

VS

 Individuals who develop open software/content (and accept the personal risk of wasted effort); and some hope to gain modest income from fee-based services (...eventually)

### Hypothetical Example

- Educational software organisation level system
- Compares two market leaders
  - Proprietary software company
  - Free/Open Source Software community
- Assumes approximate equivalence of functionality in later years <u>from perspective of many users</u>
- Many assumptions required, would benefit from refinement, many issues need further discussion...
  - But a very rough comparison is sufficient for current purposes

### Cost & Revenue for Traditional Software

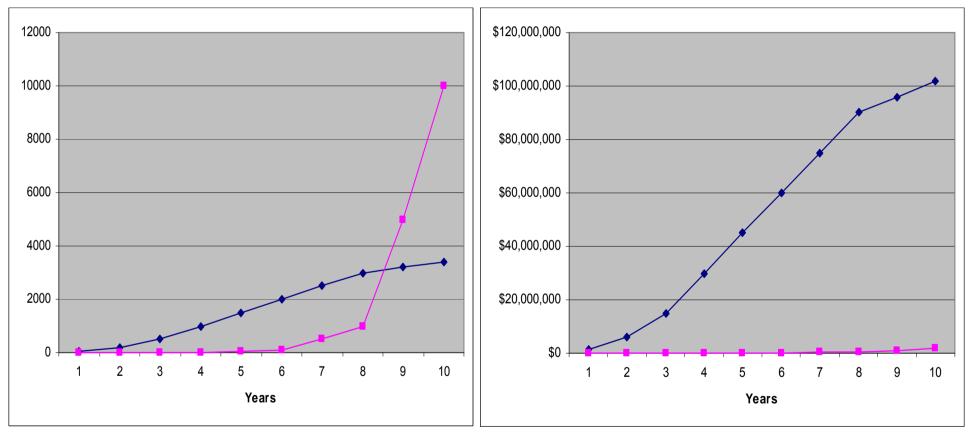

### Development Costs: Traditional vs Open

**Traditional** 

Open

# Organisational Users of Software & Revenue (Traditional vs Open)

Total Organisational users

Revenue per year

Average year 10 revenue per organisation: Traditional = \$30,000 Open = \$200

### **Implications**

- For a traditional software business, high "cost of sale" and development & admin costs force the need for substantial software license fees and large early investment
  - Risk capital investment requires high returns (eg, 50% IRR)
  - And assumes perfect execution (no wasted investment)
- For FOSS business, assumes free word-of-mouth marketing and a project leader (and later a small core group) who risk years of "bread and water" income until success & moderate services income
  - But with benefits of running own project/business (control, esteem, etc)
  - NB: Role of unfunded development from volunteers and organisations who contribute development effort (ie, pay salaries of developers)

### Open IP Business Models

- Similar models could be constructed for:
  - Other kinds of software (eg, Linux, Open Office)
  - Textbooks (Traditional vs Free collaborative textbook)
  - Encyclopedias
  - etc
- Key lesson: Open IP Business models can work under certain circumstances
  - Bread & water early years; Government/Charity Grants;
     Organisational support for creators/developers; Volunteer army

### The Question

Can you make money from Open IP Business models?

### **Answer**

Yes

# The Big Question

Can companies built on traditional copyright business models make the transition to an Open IP business model?

### **Answer**

No

## (Reason)

It's not that you can't make money from Open IP business models, it's just that if you already use a traditional copyright business model, you can't make enough money to make up for lost earnings (in the example, open earnings are \*2%\* of traditional earnings) and/or meet the expectations of return on risk capital investment

# The Really Big Question

If traditional copyright business models can't transition to Open IP models, but Open IP models start to take market share, what does this mean for traditional copyright businesses?

### Answer

War
